

All My Papers and Intactis Software Inc. form Strategic Business Partnership

All My Papers forms partnership with Intactis Software to provide MICR verification and IRD printer management technology for Intactis' Check 21 Remote Deposit Capture and IRD applications that deliver powerful, economical solutions to financial institutions.

Saratoga, CA. – July 18, 2005 - All My Papers, a developer of software toolkits designed for integration into applications used for processing and extracting data used in printing check and document images announced today a business partnership with Intactis Software Inc. Intactis is a supplier of OEM solutions to the banking industry delivered through a network of certified resellers. Intactis' i21 products offer an one-stop solution for remote capture and deposit of check payments as well as Image Replacement Document (IRD) printing and management.

Intactis has integrated All My Papers' image magnetic ink character recognition (MICR) verification and IRD print management technology into the Intactis i21 Deposit Direct solution. i21 Deposit Direct provides small to medium financial institutions the ability to rapidly implement remote capture and deposit solutions that comply with the Check 21 legislation. The i21 product suite gives financial institutions with limited resources a quick, simple path to remain competitive against larger financial institutions that are planning to makes inroads on their traditional client base.

The i21 Deposit Direct solution is an extremely cost efficient method to maintain a bank's service offerings in the highly competitive Check 21 area. The application gives financial institutions the ability to service clients regardless of their geographic location. i21 Deposit Direct allows the bank's customers to remotely scan and securely transmit checks that they normally would deposit at their branch or mail to the bank. The application uses the industry standard X9.37 file format for data transmission. IRDs can then be accurately printed using the MICR printer of the customer's choice.

All My Papers' MICR verification technology matches the electronic MICR data to an optical character recognition (OCR) read of the scanned image. The MICR to OCR verification step ensures that the printed IRDs are consistent with the original check for all data, including dashes, separators and other characters required by regulation. The IRD printing capability controls all forms, fonts, and printers. It provides for a duplex laser printer to process and print IRDs at maximum speed while minimizing network traffic.

"All My Papers sees the Intactis i21 solution as the means for small and medium sized financial institutions to have the wherewithal to compete with much larger banks without the need to implement a much more costly, and time consuming, full image solution" said Larry Krummel, founder and President of All My Papers. "We are excited to see our technology integrated into a solution that we think will be rapidly adopted by a very large user base of financial institutions offering this new capability to their customers."

"As we developed our products, which are designed for quick and easy implementation, we chose the industry's leading solution for dealing with the very important issue of image quality" said Marc Gilman, Vice President Sales and Channels, Intactis Software. "By offering a total package that can include remote image capture and print software, Security Click™ document authentication, IRD printers, check scanners and supplies, we are providing our certified resellers with a complete solution for their customers. The end user financial institution does not have to do anything except sell their banking services to their customers."

About All My Papers

All My Papers is a developer and distributor of software toolkits, applications and hardware that process, extract, and verify data used for the accurate printing of check and document images. All My Papers develops and distributes products providing high accuracy and fast printing of Image Replacement Documents, data extraction of the MICR line data on check images, the reading of barcodes, and the printing of image based documents.
